

Portfolio Sitemap Sketch

Target Audience

Recruiters seeking AI/ML interns or entry-level candidates.

Claim

I combine Mathematics, Python, and AI to solve practical, real-world problems.

Desired Action

Contact me for internship or entry-level opportunities.

Why each page earns its place:

Home: Make our claim clear. Nothing else compares for attention. Providing a reason to move forward

Work/Case Studies: Evidence without which my claim will be meaningless

About: For building trust a little faster.

Contact: The one action every prior page points to.

AI Portfolio Build

I am building a professional AI portfolio as part of an eight-week AI Fluency internship. My proof statement is: I combine mathematics, Python, and AI to solve practical, real-world problems. My target audience is recruiters seeking AI/ML interns or entry-level candidates. My primary goal is to build a portfolio that clearly demonstrates my skills, communicates my value, and encourages recruiters to contact me regarding internship or entry-level opportunities. Please act as a tutor and mentor rather than completing work for me. Guide me step by step, explain the reasoning behind your suggestions, ask questions that improve my thinking, and provide constructive feedback. Challenge weak ideas when necessary and recommend practical improvements while ensuring the final work remains my own.

Pressure Test Prompt:

AI Portfolio Build / AI portfolio sitemap review for recruiters \ Free plan · [Upgrade](#) ×

I am building a portfolio as part of my AI Fluency internship.
My target audience is recruiters seeking AI/ML interns or entry-level candidates.
My claim is: I combine mathematics, Python, and AI to solve practical, real-world problems.
My desired action is for visitors to contact me regarding internship or entry-level AI/ML opportunities.
I've attached my portfolio sitemap sketch.
Please review it from the perspective of a recruiter and pressure-test it.
Specifically:

1. Does every page earn its place?
2. Is the structure focused on supporting my claim and guiding visitors to the intended action?
3. Is anything missing or unnecessary?
4. What is the biggest weakness of this sitemap?
5. Suggest one improvement that would make the portfolio more convincing while keeping it simple.

Claude's Response:

Here's a recruiter's-eye pressure test of your sitemap.

1. Does every page earn its place?

Mostly, yes — but "earning its place" and "earning enough of its place" are different bars.

- **Home** — earns it. A recruiter skimming for 10 seconds needs the claim up front, and you've said as much.
- **Work/Case Studies** — earns it, and honestly this is the page that will decide whether you get a callback. Everything else is supporting cast.
- **About** — earns it conditionally. Trust-building is real, but recruiters read About after they've decided your work is credible, not before. If About is positioned as equally important to Work, it's overweighted.
- **Contact** — earns it, but as a page it's almost too thin to stand alone. Contact should be a persistent action (button/link in header and after every case study), not just a destination someone has to navigate to.

2. Is the structure focused on the claim and the action?

Directionally yes — you clearly thought about funnel logic (Home → Work → About → Contact). But there's a gap: nothing on the sitemap actually demonstrates the "mathematics" or "AI" part of your claim distinctly from "Python." Right now the sitemap could describe almost any CS portfolio. A recruiter scanning for AI/ML signal specifically won't find where that gets proven until they click into Work — and even then, you haven't told us what's in Work.

3. Is anything missing or unnecessary?

Missing:

- **A Skills/Tools page or section is optional and probably shouldn't be separate** — but some explicit signal of ML-specific competencies (frameworks, math areas, project types) needs to live somewhere, likely folded into Home or About, not a 5th page.
- **Resume/CV as a distinct, obvious asset.** Recruiters often want the PDF, not just prose. This isn't a page, but it should be a visible, repeated link (nav bar or header), not buried.
- **Proof of range within Work** — not a new page, but a structural note: one case study won't carry "mathematics + Python + AI." You likely need 2–3 case studies that each hit a different leg of that claim, or the claim will feel asserted rather than demonstrated.

Unnecessary: nothing here is bloated. Four pages is lean, which is good.

4. Biggest weakness

The claim is stated but not yet operationalized. "I combine mathematics, Python, and AI to solve real-world problems" is a strong claim, but the sitemap doesn't specify how the Work page will prove all three components. If your case studies lean heavily Python/AI and skip the math, or vice versa, the sitemap will structurally fail to deliver on its own promise — and a recruiter will notice the gap faster than you'd think, because they're pattern-matching against dozens of similar portfolios per day.

5. One improvement

Add a short **"proof map" annotation to the Work page in your plan** — not a new page, just a planning discipline: for each case study you build, explicitly tag which part of the claim it demonstrates (math-heavy, deployment/Python-heavy, applied AI/ML). Two or three case studies that visibly cover different legs of the claim will do more to convince a recruiter than any amount of About-page narrative. Keep the sitemap at four pages; just make sure Work is engineered to prove the claim, not just illustrate "a project I did."

One thing that I'll change:

I will ensure that my Work/Case Studies page clearly demonstrates each part of my claim by including projects that highlight my mathematics, Python, and AI skills, rather than simply listing projects.
